

# STEALTH HELIKITE

Covert Persistent Airborne Platform

Stealth Helikites provide a secure, survivable, reliable, airborne platform for communications radios, unmanned systems range extension and anti EW capability, surveillance cameras, passive ELINT, and anti-drone systems.

In today's world of radar, electronic warfare, drones, anti-air missiles and long range EO and IR imaging, all types of aircraft are increasingly vulnerable to rapid detection and attack.

Stealth Helikites are designed to autonomously lift significant payloads, thousands of feet into the sky, for many days, whilst being extremely hard to detect and destroy.

Transparent, radar stealthy and ELINT proof, Stealth Helikite are virtually undetectable in the sky during day or night. Very useful for military and police covert operations.

As Helikites utilise both helium and wind for their lift, they fly superbly compared to any other tethered aircraft and operate very well from land, boats, ships or buoys with a single operator.

Stealth Helikites have all the advantages of high altitude, all-weather capability, reliability, low cost and autonomous flight common to all Helikites, but add the unique ability to silently disappear into the sky for greatest survivability in highly contested airspace.
